TRADE ENVOY'S UNUSED TABLET

Recent archaeological research continues to find evidence of extensive trade networks spanning continents. Animal tusks unearthed in our capital prove that the routes must have extended through Spain, Italy, Greece and perhaps as far as India.

Evidence uncovered across these trading sites include luxury goods and fire making tools alongside a steady circulation of food and everyday staples.

The clay tablet discovered at the dig site (pictured right) is a rare surviving example of concealed trading communication. Unusually, the tablet appears untouched - trade tablets were typically marked or crossed through as each good changed hands, and at each market site.

ANCIENT JEWELLERY FOUND BY AMATEUR

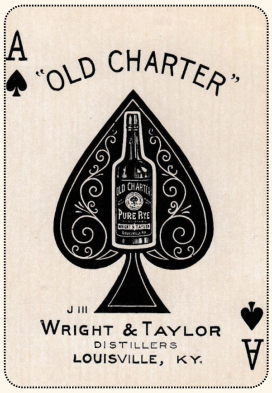

An amateur detectorist exploring farmland outside York has uncovered three ancient items of jewellery bearing unusual patterns and symbols.

Archaeologists examining the finds noted the intricate geometric markings and repeated motifs carved into the metalwork, suggesting the pieces may once have held ceremonial or symbolic significance.

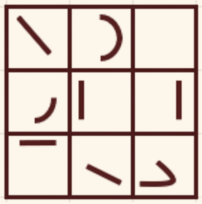

DID YOU KNOW?

In Medieval times, the letters 'i' and 'j' were use interchangably resulting in the English alphabet consisting of just 25 letters - which suited those geometrically inclined, and reduced the incidence of RSI in scribes!
